# Title: House Price Prediction- Project Summary

## Objective:
To predict house prices using machine learning techniques and identify the factors that most influence property value.

## Dataset:
Housing prices Dataset from Kaggle.

## Models Used:

- Linear Regression
- Random forest regressor

## Results:
- Linear Regression $R^2$ Score: 0.653
- Random Forest $R^2$ Score: 0.612
- Linear Regression model performed better than Random Forest .

## Key Findings:

- Area significantly affects house price.
- Houses with more bathrooms generally have higher prices.
- Preferred location and amenities increase property value.
- Random Forest produced more accurate predictions.

## Recommendation:

Real estate companies should prioritize larger properties in preferred locations and highlight premium amenities when pricing homes.

## Conclusion:

The project successfully predicted house prices using machine learning. Linear Regression provided the best performance and can be used as a reliable model for estimating house values.
